

Reflections on Chapter 16

General Thoughts

Difference in differences is a classic technique, so brushing up on it is always good. Robust adjustment for covariates is a pretty nice extension. While I think that the chapter does contribute quite a bit, it feels a bit hollow since it covers a classic technique and the new contributions are pretty trivial to roll in. In many ways this is another reference chapter.

Space for future reading

The mariel boatlift example is worth reading up on a bit more if I have extra time, just to look at how you can justify parallel trends and pull comparison data.
